

## KEEPING YOUR GUT IN CHECK

### *Healthy Options to Stay on Tract*

Your digestive, or gastrointestinal (GI), tract is a long, muscular tube that runs from your mouth to your anus. It's about 30 feet long and works with other parts of your digestive system to break food and drink down into smaller molecules of nutrients. The blood absorbs these and carries them throughout the body for cells to use for energy, growth, and repair.

With such a long GI highway, it's common to run into bumps in the road. About 60 to 70 million Americans are affected by digestive diseases, like gastroesophageal reflux disease (GERD) or irritable bowel syndrome (IBS). GERD happens when your stomach acid and/or contents come back up into your esophagus (swallowing tube) or throat. This causes uncomfortable symptoms like heartburn and indigestion. IBS is a group of symptoms that includes pain in the abdomen and changes in bowel habits. People with IBS may have constipation, diarrhea, or both. Many more people have other digestive problems, like bloating and stomach pain.

"There are many factors that can impact gut health," says Dr. Lin Chang, a GI expert at the University of California, Los Angeles. How your body's built, your family and genetic history, how you manage stress, and what you eat can all affect your gut.

Chang studies the connection between stress and IBS. Her research group has found that people who have early life stress are more likely to develop IBS. "However, this increased risk for IBS went down when people confided in someone they trust about the stress they experienced," she explains. "Finding healthy ways to manage stress is important for GI health, and your health overall."

#### **YOUR DIET & YOUR GUT**

What you eat can help or hurt your digestive system, and influence how you feel. "Increasing fiber is really important for constipation," says Chang. "Most Americans do not eat a lot of fiber so you have to gradually increase the fiber

in your diet. Otherwise you might get gas and more bloating, and won't stick with the changes."

Try to eat fruits and vegetables at every meal. A variety of fruits, vegetables, whole grains, and nuts can provide a healthy mix of different fibers and nutrients to your diet. An added benefit is that the more fiber and whole foods you eat, the less room you'll have for less healthy options.

But some fiber-rich foods, called high FODMAP foods, can be hard to digest. Examples include certain fruits and vegetables, dairy products, and wheat and rye products. If you have IBS, your doctor may recommend a diet low in FODMAPS.

You might have heard that probiotics—live microbes that are similar to those found in the human gut—can improve your gut health. These are also called “friendly bacteria” or “good bacteria.” Probiotics are available in dietary supplements and in certain foods, such as yogurt.

There is some evidence that probiotics may be helpful in preventing diarrhea associated with antibiotics and improving symptoms of IBS, but more needs to be learned. Researchers still don't know which probiotics are helpful and which aren't. They also don't know how much of the probiotics people would have to take or who would most likely benefit from them.

Certain food additives called emulsifiers are something else that may affect your gut health. Emulsifiers are added to many processed foods to improve texture and extend shelf life. But studies show they can affect our gut flora.

#### FOR BETTER GUT HEALTH

- » **Eat slower.** Chew your food well before swallowing. It may help you swallow less air and better sense when you're full.
- » **Enjoy smaller meals.** Eat in moderation to avoid overfilling your stomach and encourage digestion. A packed stomach may also cause reflux, or your food to come back up.
- » **Set a bedtime for your gut.** Try to limit how much you eat after dark. Your GI tract is most active in the morning and daytime.
- » **Manage stress.** Learn healthy ways to reduce stress like relaxation breathing, mindfulness, and exercise. Stress makes it harder to digest your food well.
- » **Create a routine.** Try to eat around the same times each day. Your GI system may do best on a schedule.
- » **Consider probiotics.** Talk with your doctor about taking probiotics (supplemental helpful bacteria). They may ease constipation and IBS symptoms.
